

# AMNIOTIC FLUID EMBOLISM

## Introduction

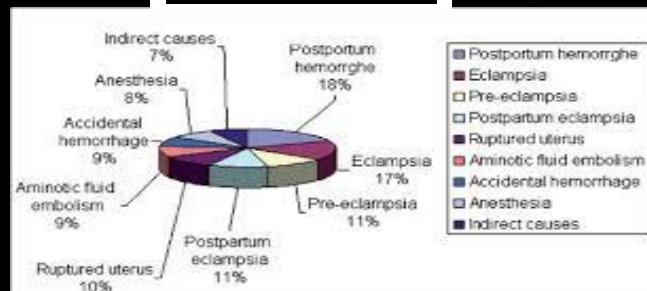

Amniotic fluid embolism also called anaphylactic syndrome of pregnancy, is a rare childbirth (obstetric) emergency in which amniotic fluid, enters the blood stream of the mother to trigger a serious reaction. This reaction then results in cardiorespiratory (heart and lung) collapse and massive bleeding (coagulopathy). A likely cause is a breakdown in the placental barrier, such as

from trauma

### CLINICAL FEATURES

### INCIDENCE

### Care of patient

- Assemble the team necessary
- Position the patient in a left lateral position Monitor material V/S, oxygen saturation , skin color , temperature and moisture level , Attach the patient to a continuous cardiac monitor

- Collect specimen for laboratory tests
- Patent IV access , catheterized & prepare for emergency LSCS

### EFFECT ON MOTHER AND BABY

- Adult Respiratory syndrome ,DIC, Left side Heart failure Neurological injury
- Fetal death
